Decline of ecological consequences of booty rud in Kazakhmys LLC by methods of nuclear geophysics

*Yefimenko S.A. (LTD "Corporation Kazakhmys"), Portnov V.S. (Karaganda state technical University), Reva N.V. (Taras Shevchenko National University of Kyiv)

SUMMARY

As this energy at the service of humanity, which will give people the opportunity to go into space, space which would be the envy Columbus, - that the primary task of science. The solution to this complex problem is at the juncture of many sciences, and one needs the efforts of scientists around the world. But the secrecy of many scientific fields leads to a vacuum of scientific thought and (or) plagiatstvu, which also affects the progress of scientific ideas. Young scientists do not have freedom of thought because of the dictatorship of the ideas of many groups, engage in any development for many years. For example Lukoil-Saratov "conducted reconnaissance in the Northern part of the Caspian basin oil and gas (black Padina) with the depth of the well up to 6 km. To my question will come from oil, I was told - from the Caspian basin, the depth of sedimentary deposits is 22 km and there is formed like oil and gas. But there is no absorption zone (subduction) in the mantle of sedimentary rocks from the new positions, and these pseudo-scouts were on the old (Gubkinskaya) theory of oil formation, which resulted in the loss of many millions of dollars. Such examples are very much in the world and in particular in Kazakhstan, where at the helm of the geological sciences are the same with the regalia of the discoverers of the post-Soviet space, and they do not want to think differently and do not give to others. Secrecy of recoverable reserves, the geological information that leads to an absurd and creates corruption. Education students are on the books of 30-40 years ago, Internet access is limited, teachers are not showing any desire for scientific work, because there is no incentive to work for peanuts and something to introduce. But the gifts of nature for the idea belongs to the people, but people do not see these resources and also doomed. For example of monitoring works, carried out in a large copper company of Kazakhstan "Corporation Kazakhstanmys" demonstrates the effectiveness of methods of nuclear geophysics at the control of ingress of lead and zinc-containing complex and lead ores into marketable ore. Developed and implemented the technology of geophysical monitoring helped to minimize the significant environmental damage and significantly improve information base ecological monitoring of ores that exploit in the ore deposits of Kazakhstan.

Зниження екологічних наслідків від видобутку руд у ТОВ "Корпорація Казахмис" за допомогою методів ядерної геофізики

*Ефіменко С.А. (ТОВ "Корпорація Казахмис"), Портонов В.С. (Карагандинський державний технічний університет), Рева М.В. (Київський національний університет імені Тараса Шевченка)
